Prescriptions for Prevention:  
A Public Health and Human-Centered Approach to Reducing Firearm Violence

Policy Paper to the 3rd Biennial Meeting of States of the United Nations Programme of Action on Illicit Trade in Small Arms and Light Weapons

14 July 2008

Issue Background: Why Do We Need a Public Health Approach to Small Arms?
Worldwide, small arms are involved in wars and crimes, suicides and accidents that result in hundreds of thousands of deaths and millions of injuries each year. In 1996, the 49th World Health Organization (WHO) Assembly identified violence as a leading public health problem worldwide. Subsequently, the WHO developed the landmark document Small Arms and Global Health prepared for the first UN Conference on Illicit Trade in Small Arms and Light Weapons in 2001. In it the WHO states that “Violence is…an important health problem – and one that is largely preventable. Public health approaches have much to contribute to solving it.”

Small arms and light weapons have been recognized as a humanitarian crisis but the dimensions of the problem are poorly understood. Despite the comprehensive nature of the UN Programme of Action (UNPoA) on small arms, the implementation of efforts around this document have been rather narrowly focused on arms management issues. The result has been a largely exclusive process, where the technical competencies of entire disciplines such as health that are centrally important to the issue have either not been leveraged or only supported by a minority of progressive donors.

Sustained high injury and death rates for violent injury require a public health commitment to develop and support action-oriented research, with a goal of collecting data on gun violence injuries and then using it to help formulate prevention policies at all levels, and which can help define successful measures for interventions. It is important to understand the context in which homicides occur in different countries. It has been recognized that several modalities of interpersonal violence occur in a complex interplay of individual, relationship, social, cultural and environmental factors. This approach for understanding the multiple levels of interaction has been defined as the ‘ecological model’. Among the universal risk factors identified that are associated with higher rates of armed violence are ready access to firearms, drug abuse or use of alcohol, and socioeconomic disparities. In a recent small pilot study conducted by IPPNW on violent injuries in five hospitals in five African countries, the probability of death due to gunshot injuries was 46 times greater that death from other types of interpersonal violence, underscoring the lethality of small arms.1
A public health approach to small arms injury focuses on the risk factors driving armed violence and the health effects of gun violence, and brings into the arena the public health community’s emphasis on scientific methodologies and prevention. Public health groups work with many sectors of society promoting a variety of measures that can reduce the frequency and severity of shooting injuries. The methods used are ones that have been developed and refined in preventing infectious and chronic diseases and injuries including polio and malaria, HIV infection, smallpox, and automobile fatalities in many countries. The same underlying approach can also reduce gun deaths and injuries. Public health methods begin with information gathering. Data on gun-related injuries will guide the identification of the risk factors that contribute to these injuries. Possible interventions can then be developed that address those factors, targeted at high risk areas and groups, tested for feasibility, and evaluated for effectiveness. Results can be used by health professionals to bring awareness to the magnitude of the problem, and to advocate for public policies and health strategies to reduce violence. Capacity building for injury prevention is one of the main challenges facing the injury prevention area today.

**How Does the Programme of Action Address the Problem?**

**Specific reference to health is made in two places in the Programme of Action:**
- The Preamble section 15 that references the challenge to human health posed by SALW;
- And further in Part III (Implementation, International Cooperation and Assistance) paragraph 18 that states: “States, regional and sub regional and international organisations, research centres, health and medical institutions, the United Nations System, international financial institutions and civil society are urged as appropriate, to develop and support action-oriented research aimed at facilitating greater awareness and better understanding of the nature and scope of the problems associated with the illicit trade in small arms and light weapons…”

**However, the PoA does not prescribe specific actions to accomplish this goal.**

**Indirect references to health are found in a number paragraphs including:**
- Reference to humanitarian consequences; reducing human suffering; assistance to victims; (Preamble 2, 4, 5)
- The need for public awareness and confidence-building programmes on the problems and consequences of the illicit trade in small arms (II. 20)
- The focus on disarmament, demobilisation, and reintegration (DDR) of ex-combatants (II.21, 30, 34, 35, III. 16)
- The emphasis on the special needs of children (Preamble 6, II.18, 22)
- Impact on women and the elderly (Preamble 6)
- The recognition of the need to promote conflict prevention and resolution, and to ‘promote dialogue and a culture of peace’ (Preamble 15; II. 20, 41; III. 4)
- The recognition of the need to make ‘greater efforts to address problems related to human and sustainable development’ (III.17)

**However, again, the PoA does not prescribe specific actions to address these issues.**

Finally, the PoA explicitly calls for simultaneously approaching the small arms issue from both the supply and demand perspectives. This call, perhaps more than any single dimension of the PoA, is the most seriously underdeveloped and the most likely to hamper the PoA’s ultimate effectiveness. One factor that is a major driver of demand for weapons is an individual's perception of security within his or her environment. Highly violent communities are therefore not just the central concern of the PoA, they are the environments which must be made less violent in order to reduce demand for small arms. The public health approach is ideally suited to engaging with community based prevention of armed violence, because it can help tailor prevention activities within the community context that are relevant...
to specific situations, and those programs can be evaluated and assessed for effectiveness, thereby providing the most direct means of driving down demand for small arms.

**Global and Regional Progress Since 2001**

Some progress has been made at the international and country levels to respond to the PoA call for action on health, including the establishment by WHO of violence focal points at Health Ministries in many countries. According to the WHO, as of 2007, 14 countries have developed a national policy document and 18 countries have produced a national report on violence and health. In addition, prior to the 9th World Conference on Injury Prevention and Safety Promotion recently held in March 2008 in Merida, Mexico, a Meeting of Ministers of Health of the Americas was held to discuss the occurrence of violence and injury and the implications of its effect in the region of the Americas and the Caribbean, resulting in a Ministerial Declaration on Violence and Injury Prevention in the Americas. The Ministries of Health committed to 13 points of action, including development, implementation and evaluation of national, state and municipal plans for violence injury prevention in each country, and strengthening the collection of epidemiological data, including information on risk and protective factors, as well as on injury and death statistics and costs related to injuries and violence. The WHO, via its Violence Prevention Alliance, has reported on notable activities in different regions of the world in three Milestones of a Global Campaign for Violence Prevention reports in 2004, 2005 and 2007. In addition, the WHO TEACH-VIP (Violence and Injury Prevention) module, designed to educate health professionals, policy makers and others, is gradually being disseminated and used at the country level in medical and public health schools and elsewhere to encourage implementation of intervention programs that can be evaluated for efficacy and perhaps replicated.

However, little progress has been made on systematically integrating public health measures into preventing and reducing small arms violence. In particular, action-oriented research has received very little support from donor countries supporting work in connection with the PoA, although it has been undertaken in small pilot ways by NGOs as well as more systemic ways in a very few countries by WHO and local health and UNDP partners. The Geneva Declaration on Armed Violence and Development, whose convening meeting was hosted in 2006 by Switzerland and the UNDP, and was initially signed by 42 states and 17 international organizations, has called for more donor investment in violence prevention. The WHO companion report, *Preventing Violence and Reducing Its Impact: How Development Agencies and Governments Can Help*, details the health effects of violence and how it obstructs achievement of the Millennium Development Goals. The report identifies data collection and research on violence prevention (especially evaluation) as a top priority, and engaging health the health sector as one of 4 “best buys” for donor investment for reducing the consequences of violence.

**Recommendations to States:**

IPPNW and the IANSA Public Health Network seeks to make the impacts on health of armed violence more widely understood and aims to assist governments in gauging feasible policy options to address them. We recommend the following as a basic action agenda to help states incorporate public health strategies into their National Action Plans. Some of these require no substantial resource investment but may require the involvement of Ministries of Health and other government agencies and civil society sectors including medical and public health organizations and communities.

- **BMS outcome documents should refer explicitly to the need for a comprehensive supply and demand approach** to the control of small arms & light weapons proliferation.

- **Recognize that health and development are intricately linked** as highlighted in the Millennium Development Goals and the Geneva Declaration, and encourage states to invest in prevention.
programs by integrating public health strategies into National Action Plans, including those related to development, health and poverty reduction.

- **Ensure health representation on National Commissions on Small Arms**, and that at minimum the Ministry of Health is represented and ideally an NGO member of the health community as well, to help assess the most strategic investments based on highest needs.

- **Implement national collection of data on gun-related deaths and related costs**, needed to guide prevention planning, identify high-risk groups and areas, and to monitor the effects of interventions. **Support hospital- and community-based research projects to provide details on gun-related injuries**, which are needed to identify risk and resilience factors, and assure proper prevention and management of victims. The cost of this should be included National Commission budgets.

- **Increase support for victim assistance programs** that include comprehensive follow-up to ensure productive reintegration of individuals into society.

- **Educate the medical community, students, the media, the public, and policy makers about the public health burden of gun-related injuries.**

- **Encourage more involvement of the injury prevention community in gun-related injury prevention.** This group can help to apply decades of experience with public health approaches to the prevention of injuries from small arms and light weapons.

These recommendations add nothing new to the Programme of Action - they simply provide a framework for more effectively realizing the commitments that are already there.
